

## GENESIS DE SUELOS SOBRE CALIZAS

### SUMMARY

Genesis of soils developed on Cambrian Lime (West Andalusia, Spain) are studied. Exist hematites neoformation in the upper layer of the soils and goethite at the depth; manganese oxides have similar evolution. A new term of american classification is introduced for soil with high content of sesquioxides; Ferrixeralf; also for the french classification; Fersialitic ferruginous soil; and Ferritic brown earth is considered in Kubiena's classification.
